Poorly marginated lung metastasis (arrows) in a canine anaplastic carcinoma. The CT is the standard of care for accuracy in the diagnosis lung metastasis in veterinary medicine and human medicine. It is much more accurate than the standard three radiographs to determine lung metastasis. The CT scan takes 5 minutes or less and can often be done as a day patient or outpatient if the owner is willing to wait a few hours. (See charges outlined in the sidebar.) Available at CCVS-BB, call to schedule 1-800-457-4900.
