

Hydro Excavation

Hi Tech Successfully Located and Surveyed 32 Potholes in 2 days

Hi Tech Industrial Services were contracted in by a local Western Sydney Council to assist in the preparation of a proposed road widening. This meant that before any construction works could begin, all live underground cables and pipes needed to be located and then exposed via potholing. Potholing is the ideal method regularly used by Hi Tech industrial Services to expose critical utilities via this form of non-destructive digging with high pressure water. Clients prefer this method when compared to conventional methods of excavation, due to less risks and or damage to the buried utilities.

Hi Tech successfully located and surveyed 32 potholes in 2 days. The success of this job can also be attributed to the efficiency of the fleet vehicle used to transport the waste. Hi Tech did not have to leave site numerous times to dump the waste. The King Vac 9000 truck only left site once to dispose of the Vacuum Excavation mud.
