

ONDAMED And Multiple Sclerosis

Discovering that you or a loved one has Multiple Sclerosis (MS) can be a traumatizing and very difficult task to endure, but it doesn't have to be. The practitioners using ONDAMED have found a way to help alleviate some of the symptoms and suffering that a person with MS may experience in different stages.

MS is a common disease of the central nervous system in which the myelin becomes damaged, thus interfering with communication between the brain and other parts of the body. This miscommunication can cause a person to feel such symptoms as dizziness, blurry vision, weakness of the arms or legs and/or bone density. Today there are more than 2,000,000 people throughout the world that are suffering from this disease.

ONDAMED has been proven to offer an overall higher quality of life in patients with MS.

ONDAMED Works

Physicians and private individuals have been utilizing the ONDAMED therapy for close to 20 years. The Technology works with a combination of biofeedback and localized tissue stimulation to release toxins from cells and tissue, while improving metabolism functions, flow of the lymph and impacting the nervous system. When the toxins are released, a person begins to feel better and more relaxed, thus offering a better well-being and way of life. ONDAMED stimulation induces subtle current impulses in the body's fluids, organs, tissue and cells.

A common symptom of MS is the deterioration of muscles and bone density. By using ONDAMED, you can help slow down the progression of deterioration, and more over build bone strength. A person receiving the ONDAMED therapy is relaxed throughout the therapy session and leaves energized and feeling much better. The therapy is not a one-time event and needs to be done in a two pronged approach; to first stabilize the patient, followed by building patients' health.
