

## **2016 Lawn Program Steps**

### **Step 1 - March/April**

Fertilization with Crabgrass Preventer. This is a dry application with a 90 day duration.

### **Step 2 - April**

Broadleaf weed spray. This is a liquid based application. It is an Ester bases product for better control of Clover, Lespedeza, and many other broadleaf weeds that are more chemically resistant.

### **Step 3 - May (Optional)**

Second spring feeding. This is a dry application. This step is primarily offered for clients who have irrigated lawns and would still like to have a second spring feeding. It is not a necessary step since step 1 has a 90 day duration with a quality product.

### **Step 4 - June**

Second weed spray including Crabgrass Preventer. This is a tank mixed application of herbicide and barricade. This allows better timing for weed control than a split application.

### **Step 5 - July/August**

Grub and Insect Control. This step will remain the same as prior years.

### **Step 6 - September**

First fall feeding. This is a dry application. This step will be the same as prior years, but we will be using a premium product and different ration of active ingredient.

### **Step 7 - October/November**

Second fall feeding. This is a dry application. This step will be using a premium product with quick release properties. Feeding at this time will ensure an effective delivery to the root system of your lawn.
